Price Offer – BI Application Development for Magalcom

1. Background

Magalcom manages thousands of projects of various sizes across the world. Most ERP operations are currently performed using a highly customizable Magic-based system, accessed via the Magic desktop client. Magalcom aims to gradually modernize by adding web and mobile applications, alongside an AI chat-style interface and agentic workflows.

Simple Vision Ltd. was founded by Yair Cohen, a seasoned software architect with 25 years of experience designing and delivering web and distributed systems for a variety of organizations.

2. Opportunities

A lot of SaaS companies struggle to adopt to the new era. Those offering usually requires the business to change and adopt proven processes, often leaving team members aside, sometimes requires special skills to change and add features as the business evolve. Customized, AI friendly, web application can make a big difference reducing integration time to almost zero as the software is built around the business instead of the opposite, no need for special skills, built on proven and common technologies, allowing easy recruiting and development.

Magalcom can find itself in a “Sweet Spot” as the current processes are wielded into 30 years old Magic (fabulous and great software, but old and out of date) and can benefit a lot moving to advance web & mobile technologies. Usually, this transition took place by using SaaS offerings, as development of products costs orders of magnitude and sharing the cost made a lot of sense. This required the business to adopt its processes, sometimes loosing real business insights and organizational memory, slow and hard onboarding processes and delaying or avoiding required customizations due to price.

As AI technologies advance, and especially in the Code & Development fields, a real opportunity emerges to “Skip the gap” between traditional heavy desktop and client/server applications directly to highly customized web & mobile applications without investing fortunes on adopting business processes to existing SaaS offering, scale as needed and not shared by thousands of companies, agile and flexible enough yet robust and secure on the highest level.

This offer starts with the very basic infrastructure required for such development with the first module planned as CRM Leads management. The development will be optimized to fast and short development cycles, ease of maintenance and change by common technologies.

3. Scope of Work

The scope of this project is to build a secure and modern web application platform that enables API and web access to a BI module, and to add an AI chat-style interface for querying the BI data.

The offer includes the following components:

3.1 Infrastructure

Deliverables:

- A web application “shell” accessible via modern browsers.
- Authentication and authorization using Microsoft Entra ID (Azure AD) and pre-configured security groups.
- A server-side API layer (ASP.NET Core) to serve the client application and expose BI endpoints.
- Backend services to support long-running processes, scheduled tasks, notifications, and integrations.
- Foundational logging and basic operational diagnostics.
- Hosting “mini apps” as a way to isolate & speed up development by departments (Sales, Maintenance, etc.) or vertical domains (like BI/ CRM/ Invoicing, etc.) each “mini-app” benefit from contextual information like the current user token & roles, as well as environmental information and focus only on providing the specialized UX it was designed to.
- Server side will also designed for easily adding new APIs in isolated and secure way to support such mini apps.

Acceptance criteria:

- Users can access the application from within the Magalcom network.
- Users authenticate via Microsoft Entra ID.
- After login, users are routed to a home screen displaying the current user identity and authorization context (e.g., roles/groups).

3.2 CRM Leads Module

Deliverables:

- API endpoints and application components that allow sales personnel create and track leads.
- A Report screen to show prediction based on leads, grouped by projects.
- Basic Role Based security & Scoping - each.

Acceptance criteria:

- After login, the user can open the Leads page, add and update leads
- User can generate related reports (by department, domain, sales person,etc), see predictions and drill down to specific project or domain.
- Admin users will be able to update Projects & Formulas for calculations.

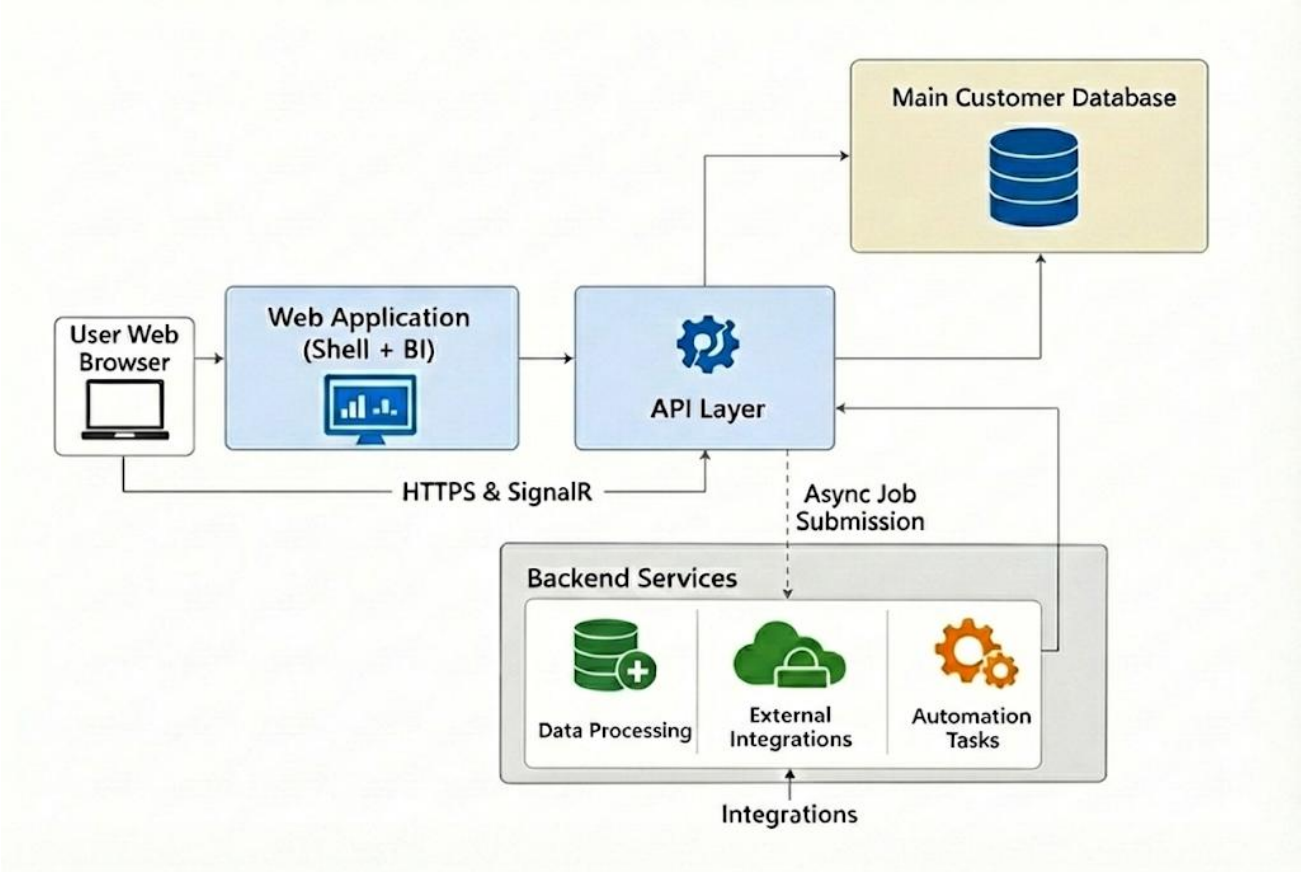
4. Technical Approach

Development will use the Microsoft .NET (C#) technology stack in order to maximize maintainability, developer availability, and documentation quality.

Key components:

- Client: HTML/CSS/JavaScript (framework to be selected: Vue or React).
- Server: ASP.NET Core application connected to Microsoft Entra ID, providing authentication and authorization.
- Communication: HTTPS and, where needed, SignalR for real-time updates.
- Data: Microsoft SQL Server (existing).
- Messaging/queues (if required): Azure Service Bus or on-prem RabbitMQ (selection to be aligned with Magalcom infrastructure).

Architecture Diagram



5. Optional Additions

- UI/UX design: The UI design in this scope is a best-effort based on our experience. Working with a customer UI designer is out of scope unless agreed separately.
- Mobile application: The web application will be optimized for desktop. While most modern mobile browsers may work, mobile-specific adaptations or a native mobile app are out of scope unless agreed separately.

6. Implementation Plan and Estimates

Stages:

- Stage 0 – Specifications, Design & Architecture: requirements gathering and documentation.
- Stage 1 – Infrastructure development, including Microsoft Entra ID integration.
- Stage 2 – CRM Leads Module.
- Stage 3 – Acceptance tests: end-to-end testing and customer sign-off support.

Estimated effort (working days):

- Stage 0 – 5 WD
- Stage 1 – 10 WD
- Stage 2 – 8 WD
- Stage 3 – 5 WD
- Total – 28 WD

7. Methodology

- Architecture & design: based on the IDesign.net method for resilient, scalable, and flexible systems.
- Staged development (agile): delivering value at the end of each stage with customer-visible progress.
- Git workflow: small, deterministic tasks merged via pull requests and review.
- Tooling: We may use AI assistants, IDE features, and automation tools; all delivered code is reviewed, supported, and maintained as standard production code.

8. Hosting and Deployment

- This offer assumes hosting of the application on Magalcom servers.
- Deployment will be coordinated with Magalcom IT/DevOps. Basic deployment automation (e.g., scripts/pipeline configuration) will be included in the repository, as applicable.

9. Licensing and IP

- Development tools used by Simple Vision are properly licensed.
- The customer is responsible for maintaining its own developer and infrastructure licenses (e.g., Windows Server, SQL Server, Azure/Microsoft subscriptions).
- If an external paid component is required, it will be proposed to the customer separately for approval.
- Source code produced under this offer is fully owned by Magalcom.

10. Maintenance and Support

- The customer will receive the full source code, stored in the customer's Git repository (GitHub or equivalent), hosted in Magalcom servers.
- Documentation will be provided covering the codebase and how to implement new features.
- Three (3) months of post-release support is included, with the release date to be defined during Stage 1.

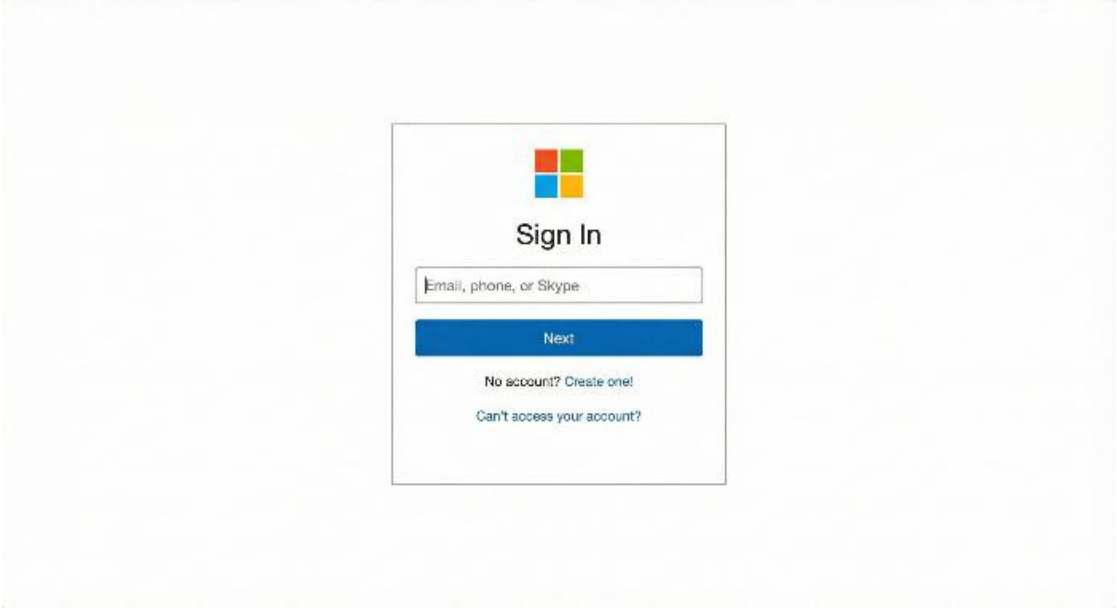
11. Pricing

- Total project price:
  - Infrastructure: 38,000 NIS (excluding VAT).
  - CRM Leads: 17,000 NIS (excluding VAT).
- Optional yearly support (critical bug fixes related to the original development): 12% of the total project price per year.
- Additional development (non-critical bug fixes and new features): 450 NIS per development hour.
- Prices do not include VAT.

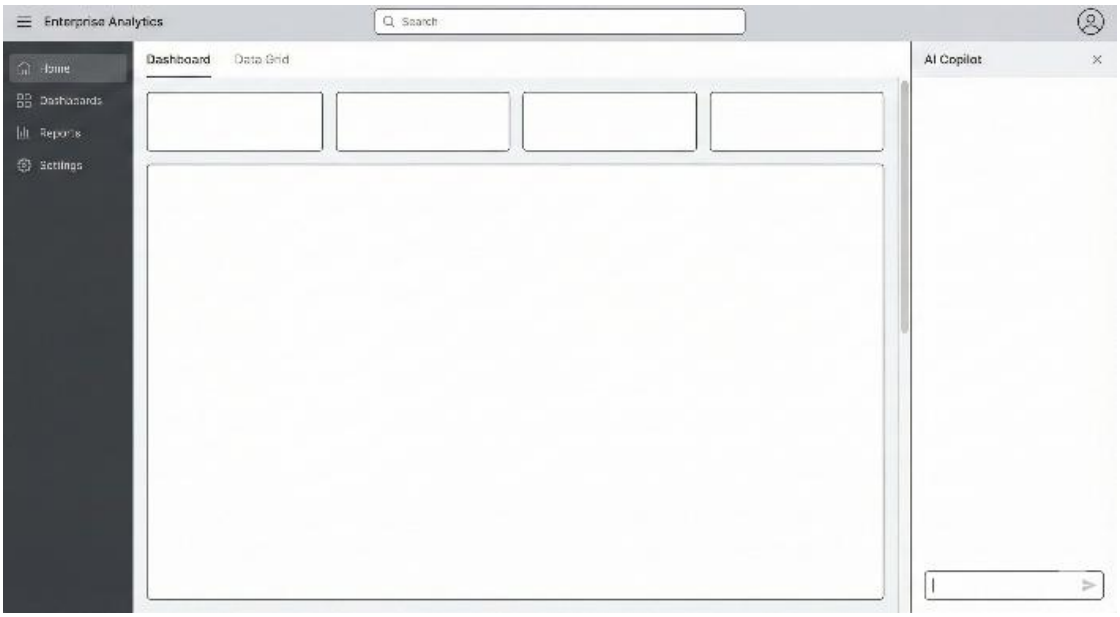
Work will be performed mostly remotely using a mock database, with periodic onsite visits to Magalcom offices for development and integration within the local network. VPN access is required from Stage 3 onward.

Appendix A – Illustrative Screens

The following screens are illustrative only and are provided to communicate the intended user experience.



Example: Microsoft Entra ID sign-in experience.



Example: BI screen layout (dashboard area and chat panel).
